

Corrected system flowchart

Redrawn against the live codebase, module by module. Every box below is something the system actually does today — nothing aspirational, nothing that used to exist and got removed.

● 7 kept as-is

● 3 corrected

● 4 removed

● kept

matches the system, unchanged

● corrected

was wrong, redrawn to match reality

● removed

described a feature that doesn't exist

WHAT CHANGED

Six corrections, at a glance

Main flow

Module list

● corrected

5 modules → 10. Personnel, GPS Tracker, Calendar, Notifications, Mr. UBRA AI, and Settings existed in the system but not in the diagram.

Main flow

"Display Role Dashboard"

● corrected

Every role sees the identical dashboard. Relabeled to "Display Dashboard" — there is no role branch in the code.

Module A · Tools

Identity check + approval step

● removed

Borrowing trusts whatever name is typed and completes instantly — no verification lookup, no approval gate exists.

Module B · Vehicle

Request → assign driver → pre-trip → tire PSI

● removed

This was the Travel Management / Trip Ticket workflow — deliberately deleted from this codebase earlier in the project. Redrawn as the simple add/edit flow that

replaced it.

Module C · Safety

AC runtime tracking + email reminder ● removed

No usage-hour trigger and no outbound email exist anywhere in the app. Redrawn around the real due-date check that fire extinguishers actually use.

Module D ·
Janitorial

Supervisor 1–5 star rating ● removed

A rating column exists on an old, disconnected table — not wired to the live checklist feature. Not shown as working.

Main flow

All ten real modules now branch from **Select module**, and the dashboard step no longer implies role-specific content.

10 branches, matching app/Views/layouts/main.php

A

Tools Management

● corrected

Scan → availability check → borrow, exactly as the mobile app implements it.
No identity verification or approval step is drawn, because none exists yet.

Api::toolsScanBorrow() - app/Controllers/Api.php

B

Vehicle Management

● corrected

Replaces the old trip-ticket request/approval workflow. A vehicle record is created or edited directly — there is no separate request, driver-assignment, or inspection stage.

VehicleController.php + Api::addVehicle()

C

Safety Maintenance

● corrected

Fire extinguisher due-dates drive the only working alert logic today. **Aircon** has a real backend (mobile-side) not yet wired to this screen; **Buildings Check** is a placeholder. Neither is drawn as functioning.

SafetyController::index() / drillDown() - no email dispatch, no runtime-hour trigger

D

Janitorial Monitoring

● corrected

Checklist completion loops until every task in a zone is done. No rating step follows — that field lives only on an unused, disconnected table.

D

Open Janitorial Monitc

Select cleaning z

All tasks complet

Api::saveJanitorialChecklist() - app/Controllers/Api.php

Yes

Display zone: C1

End

E

Records, Archiving & Reports

● kept

This module matched the system already — the 1-year inactivity threshold, disposal log, and digital sign-off are all real. Only the export label changed: the "Excel" file is CSV with an .xls extension, not a true binary workbook.

E

Open Records, Archiving & Re|

Scope note: Personnel, GPS Tracker, Calendar, Notifications, Mr. UBRA AI, and Settings appear as single boxes in the main flow above — they weren't detailed sub-flows in the original diagram, so none were drawn here either. Ask if you want any of them expanded to the same level of detail as A–E.

Every box on this page was checked directly against the running source — controller methods, model queries, and table columns — not inferred from the UI alone.

```
graph TD; Start(( )) --> Display[Display: process complete]; Display --> End((End));
```

Display: process complete

End
